

Correction DR de SI, VTP, sept 25, WHING

- Q1) 10 ou 15 km/h max, 120 Kg masse, $t < 2$ minutes
- Q2) Amorce et base roulante
- Q3) 2 moteurs + 18 véris
- Q4) Capteurs à effet Hall
- Q5) $\vec{OA} = \vec{OB} + \vec{BA} \Rightarrow \dots \tan \gamma = \frac{b + l_1 \sin \beta - d_1 \cos \beta}{-a + l_1 \cos \beta + d_2 \sin \beta}$

Q30)
$$\begin{cases} N_A + N_B + N_C - \frac{mg}{2} \cos \alpha = 0 & (\text{voir schéma}) \\ T_A - T_B + T_C - \frac{mg}{2} \sin \alpha = 0 \end{cases}$$

$$\sum \vec{n}(B) = \vec{0} \Rightarrow -N_A (a - d - \delta_2 + \delta_3) - \frac{mg}{2} \sin \alpha \times c + \frac{mg}{2} \cos \alpha (d - b - \delta_2) + N_C (b - \delta_1 + \delta_2) + C_{red} = 0$$

Q31) Roues arrière et avant :

$$\begin{aligned} -N_C \times \delta_1 + T_C \times r_3 &= 0 \\ -N_A \times \delta_3 + T_A \times r_1 &= 0 \end{aligned}$$

Q32) Roue motrice

$$C_{red} - N_B \times \delta_2 - T_B \times r_2 = 0$$

Q33) Limite glissement

$$\begin{aligned} T_B &= f \cdot N_B \\ C_{red} &= N_B \delta_2 + T_B \frac{r_2}{2} \end{aligned} \quad \left| \begin{array}{l} 7 \text{ equations} \\ 7 \text{ inconnues : } N_A, N_B, N_C, T_A, T_B, T_C \\ C_{red} \end{array} \right.$$

~~T_B de r_2 r_2~~

$$C_{red} = 3,4 \text{ Nm}$$

avec :

$a = 0,928 \text{ m}$

$b = 0,38 \text{ m}$

$c = 0,5 \text{ m}$

$d = 0,6 \text{ m}$
