

## Problématique

Isn't the improvement and optimisation of the road system a better alternative to confront the problem of urban traffic than these flying taxis

## PLAN

-Even with the best technologies known today, making an object (heavy) **fly** requires a lot of energy -> not that good ecologically speaking even if electric

-**Road** can theoretically be sufficient to handle all the traffic needed, without any traffic jam, if they were more carefully designed

-**Re thinking what already exists** will be necessary at some point anyway, as if we don't optimize the system, the sky shall one day be saturated as well -> we can't just keep going up without a strong foundation

## CONCLUSION

Developing new technologies is great, but it is not what we need now to fight climate change and overpopulation. What is required is designing smarter, more efficient systems, and this apply to the question of urban traffic.
