ESSAY:

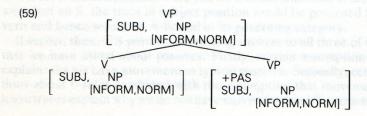

Can science provide us with the truth in all cases?

All we need, then, is some way of ensuring that the higher VP [SUBJ,NP[NFORM,NORM]]. We can do this by assigning was to the ing category:

The important point about this category is that the SUBJ feature with value of SUBCAT has a variable as its value and the main SUBJ feature I same variable as its value. When was appears in a tree, the Subcategori Principle will ensure that the category within the SUBCAT list is ident the complement and hence that it has the same value for SUBJ complement. In the present case, this means that the variable will be in ated as NP[NFORM,NORM]. Since we have the same variable as the value main SUBJ feature, this too must be instantiated as NP[NFORM,NORM]. Hence, we will have the following category in the tree:

If was is [SUBJ,NP[NFORM,NORM]], the head-complement rule will that the higher VP is as well. Hence, we will have the following structure middle of the tree:

The truth about something is all the facts about it, rather than things that are imagined or invented.

If something is **true**, it is based on facts rather than being invented or imagined, and is accurate and reliable.

Scientists say the chicken came first - but they're just <u>eggheads</u>

The 'which came first' conundrum has been solved at last. Or has it?

• William Skidelsky, *The Observer*, Sunday 18 July 2010

Last week, it was claimed that one of the oldest conundrums known to man had been laid to rest, when scientists at the universities of Sheffield and Warwick announced they'd found evidence that the chicken really did come before the egg. A study into how chicken eggs are formed discovered that a protein found in the chicken's ovaries, ovocledidin-17, is vital for shell production. According to the researchers, this means the chicken must have come first.

Is there anything more to this than an entertaining news story? Perhaps not because, as one of the scientists involved in the study conceded, there were other types of <u>egg-laying</u> species that pre-dated chickens, and these didn't necessarily produce their eggs the same way. Just because a <u>hen</u> is needed to produce a chicken egg, this doesn't mean a dinosaur egg couldn't once have existed without a tyrannosaurus. Besides, the theory of evolution has long since rendered the chicken-egg dilemma something of a non-mystery anyway: once you allow species <u>adaption</u> to enter the equation, it is fairly <u>straightforward</u> to see how a new egg-laying species might come about.

Yet the fact that the puzzle, understood literally, is a non-mystery doesn't really matter, because its true significance has always been more metaphorical than scientific. As the ancient philosophers who first formulated it understood, it was a way of pointing to the mystery of first causes — of what created the universe, and how that entity might have come into being. And the puzzle remains useful today as a <u>shorthand</u> for any type of situation in life where causes can't be <u>disentangled</u>.

For instance, many people might reasonably ask: "Is my life a mess because I am unhappy, or am I unhappy because my life is a mess?" Where such uncertainties remain, we'll always have recourse to the chicken-and-egg conundrum, whatever the latest scientific research says. (335 words)

1- **Introduction:** Although it is the dream of many scientists to find the truth, it seems that it is easier said than done because the essence of science is to raise new problems, but also, and above all, because the truth is multifaceted.

2- PLAN

1) If truth = based on proved facts → then science means truth

- except that sometimes there are cheaters
- except that all discoveries lead to new questions → never-ending process / no absolute truth

[Give examples]

Transition: - Galileo → what is true may not be accepted as such because of other factors.

2) sometimes the truth that is being looked for is not scientific

- chicken and egg = more philosophical = no one really cares about the actual answer
- creationism → are science and religion compatible? → for some scientists it is → there may be several kinds of truth

Conclusion → science can provide us with a <u>scientific</u> truth in <u>most</u> cases, but are all truths scientific truths?

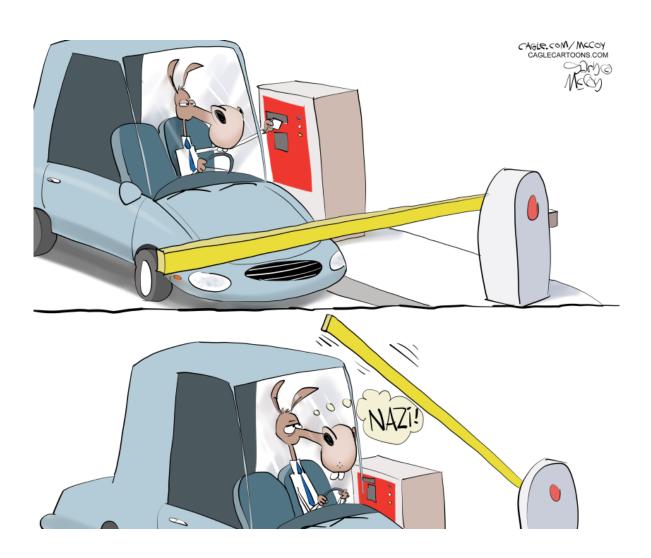

3- **Useful quote:** "Science never solves a problem without creating ten more" (George Bernard Shaw)
